Video Player

Once you have been notified by Allstar that your clip has been submitted for processing, you are ready to display the Allstar iframe on your site. In the response to your webhook, you should have received a source URL that you need to pass to the iframe rendered on your site.

The source URL will resemble the following format:

```
https://allstar.gg/iframe?clip=<CLIP_ID>&known=<true | false>&platform=<INTERNAL_PARTNER_ID>&useC
```

There is one required query parameter that must be appended to this source. Below, you will find a table outlining this required parameter along with various optional query parameters that control the behavior of the player inside the iframe.

Parameter	Value	Functionality	Required
UID	[UNIQUE_IDENTIFIER]	This parameter allows us to know if the user watching the clip owns it. For CS:GO or CS2, please pass us the Steam64 ID, e.g., UID=76561197960287930 For League please pass us the URL Encoded Riot ID, e.g., UID=encodeURIComponent("john#NA1") Note: This is required for all cases where this information is available to you about the user viewing the clip in your application or platform.	TRUE
background	true	Disables video player controls and autoplays the video. Intended for when rendering the iframe as a background video.	FALSE
fullscreen	true	Attempts to auto fullscreen the video when the user clicks play. Requires the iframe attributes allowfullscreen, mozallowfullscreen, webkitallowfullscreen to function.	FALSE
loop	true	The video will loop.	FALSE
autoplay	true	Autoplays the muted video when the iframe loads.	FALSE
location	homePage, userProfile, matchResults, matchHistory, watchFeed	An enumerated list of locations indicating where in your application/site the iframe is being displayed ¹ . We use this information to augment viewership metrics so you can better understand how your users are engaging with our clips.	STRONGLY ENCOURAGED
sublocation	[string]	A non-enum specifier for location that you may use to better qualify where the iframe/video player is being displayed	FALSE

Additionally, please add `allow="clipboard-write"` to your iframe attributes to enable users to copy the clip link from inside the iframe if they wish to share it.

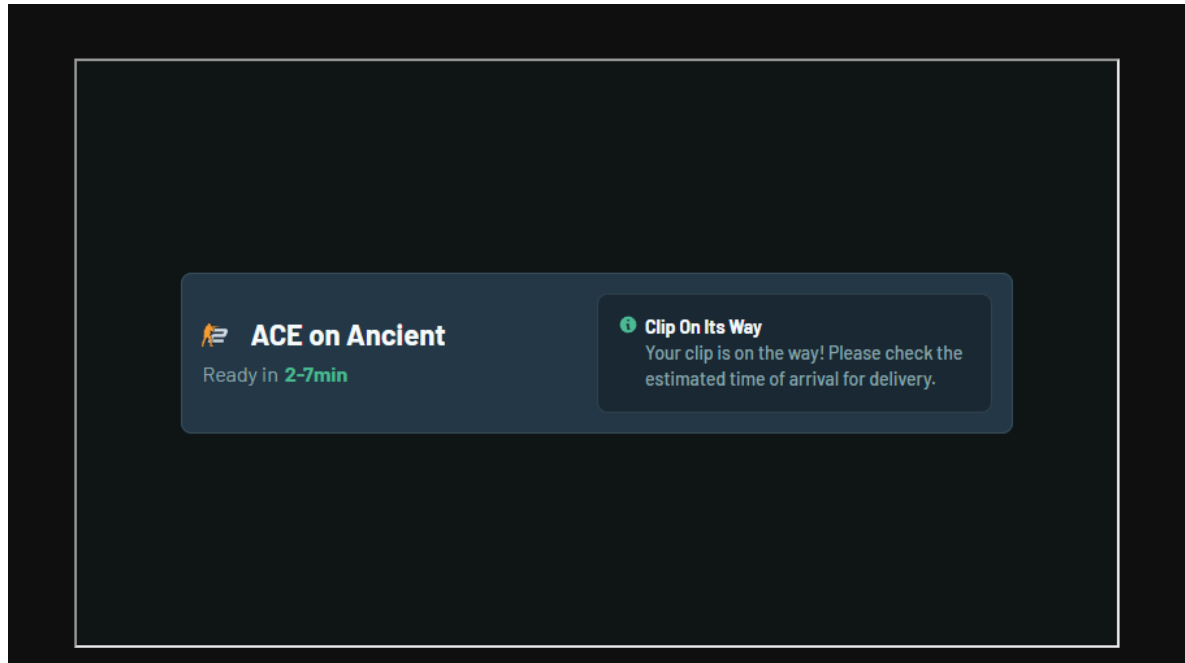

Example HTML:

```
<iframe allow="clipboard-write"
        allowfullscreen
```

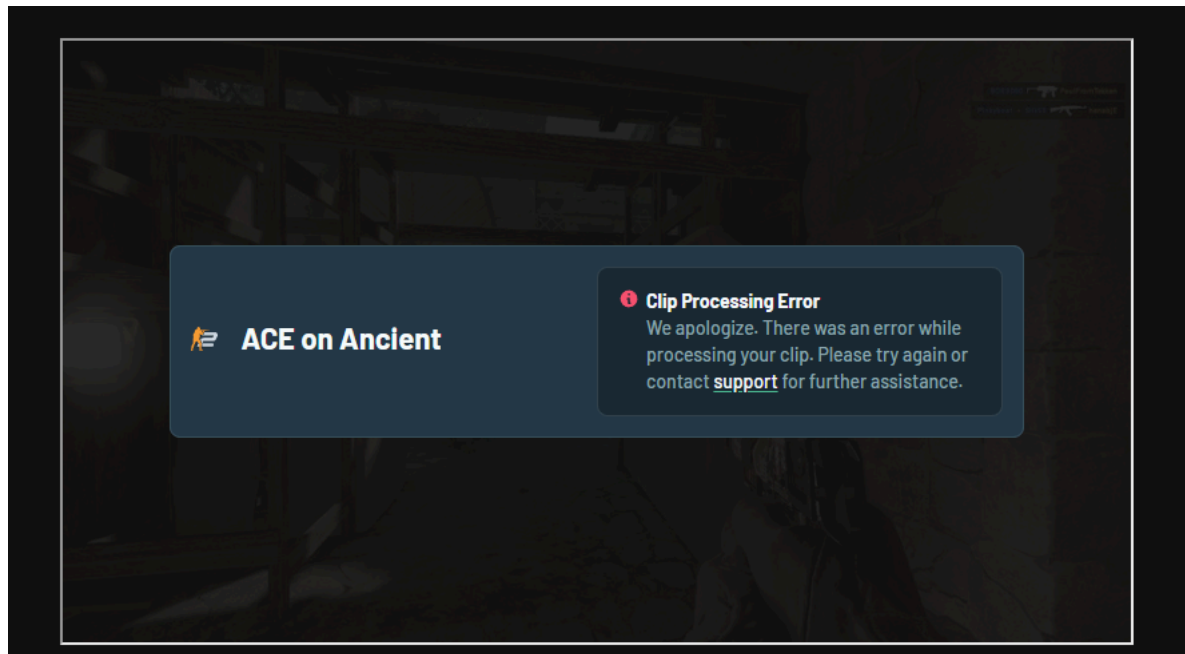

```
mozallowfullscreen
webkitallowfullscreen
src="https://allstar.gg/iframe?clip=YOUR_CLIP_ID&known=true&platform=YOUR_INTERNAL_PARTNE
</iframe>
```

Before the clip is complete, the user will see transitional information.
