Webhook Introduction

Introduction

Learn how to use webhooks to be notified of Allstar activity. Webhooks provide a way for your application to be notified when specific events happen in Allstar, allowing for real-time updates.

Setting Up Your Webhook URL

You'll need to provide a URL that Allstar can use to send webhook events. This URL points to a server on your side that is set up to receive webhook requests. You can do this on a per request basis by sending it along with your request using the key `webhookUrl` or you can request that Allstar set a default for your partner account.

Types of Events

Allstar sends webhook events for a variety of actions, including clip status updates and account activity. For a full list of events, see [Events](#).
